RE:	NovaTech Unified Revenue Dashboard — Summary Report

The NovaTech Unified Revenue Dashboard consolidates CRM deals, marketing campaigns, and support tickets into a single interactive view of the customer lifecycle. It replaces the manual process of pulling data from three separate systems and gives the revenue team a reliable, always-current source for weekly decision-making.

DATA STRATEGY

The dashboard uses three datasets: **CRM deals** (opportunity-level sales data), **marketing campaigns** (lead generation and channel performance), and **support tickets** (post-sale customer issues and sentiment). Each dataset was validated through Q to confirm field names, data types, and expected values before any visuals were built. The three sources were joined on account identifier, with CRM deals as the base table. Because one account can have multiple deals, campaign touches, and tickets, all aggregate metrics use distinct counts and conditional logic to prevent double-counting from the join.

DASHBOARD DESIGN RATIONALE

The dashboard is organized into three sheets, each supporting a different decision. The **Marketing Funnel** sheet tracks lead volume by channel and funnel stage to help the team evaluate campaign effectiveness and identify where prospects drop off. The **Sales Pipeline** sheet displays win rate, average close time, and won revenue by company size and sales rep to guide pipeline prioritization. The **Customer Health** sheet monitors active ticket volume, resolution time, and sentiment by priority level to flag at-risk accounts. Two cross-sheet filters — Campaign Name and Customer Tier — allow any selection on one sheet to update all three, so the team can trace a single campaign or segment across the full lifecycle.

TOPIC CONFIGURATION AND Q ACCURACY

Before the Topic was configured, Q returned inaccurate results — win rate queries produced raw counts instead of percentages, and revenue queries pulled list prices instead of deal values. After the Topic was updated with calculated fields for win rate, days to close, won revenue, and resolution hours, Q began returning correct answers directly. Multi-dataset questions such as “show me won revenue for accounts with critical support tickets” also became possible for the first time. The Topic configuration turned Q from a tool that required manual interpretation into one that reliably supported exploratory analysis.

KEY INSIGHTS AND RECOMMENDED ACTIONS

Four findings emerged from the dashboard:

1. **Partner Referral generated 19,717 leads (31% of total)** but channel-level conversion rates are not yet visible. A conversion analysis by channel should be conducted to determine whether this volume translates into closed deals.

2. **Enterprise accounts contributed $319,423 in won revenue — 45% of the $703,090 total.** The team should prioritize Enterprise-focused campaigns and evaluate whether sales effort on smaller segments is justified.
3. **The funnel shows a 76.6% drop-off between Qualified Lead and Opportunity stages** (21,330 down to 4,993). Funnel stage definitions and CRM data entry practices should be audited, and if the gap is real, sales enablement at the Opportunity stage should be strengthened.
4. **2,792 active support tickets average 58.4 hours to resolve,** and critical-priority tickets cluster with negative sentiment. A weekly triage of critical tickets should be established with a target resolution time under 24 hours.

AI ANALYSIS VS. DASHBOARD COMPARISON

Q and the dashboard agreed on headline metrics: **63.7% win rate**, **$703,090 won revenue**, and **58.4-hour average resolution time**. However, the dashboard was still needed in three areas. Q occasionally returned inflated totals due to row duplication from the join, while the dashboard's calculated fields produced accurate numbers. Visual patterns — such as the clustering of critical tickets with negative sentiment on the heat map — could not be detected through text-based Q answers. Cross-sheet filter behavior also required direct dashboard testing to confirm that selections propagated correctly across all three sheets.

CONCLUSION

The dashboard gives the revenue team a single view that supports weekly decisions across marketing, sales, and support without manual data pulls. Future iterations should add trend lines, channel-level conversion rates, and predictive churn scoring to make the analysis more forward-looking.
